AGENTIC AI HANDS-ON COURSE
Capstone Project Report

Title: HR Policy Assistant

Name: Aditya Kumar Prajapati
Roll No: 23052540
Batch: Agentic AI 2026

Instructor: Dr. Kanthi Kiran Sirra

College Name: KALINGA INSTITUTE OF INDUSTRIAL TECHNOLOGY

Problem Statement

Employees frequently ask repetitive HR-related questions such as leave policy, working hours, benefits, and resignation procedures. These queries consume HR time and delay responses.

There is a need for an intelligent assistant that can provide instant, accurate, and policy-based answers without human intervention.

Solution / Features

This project presents an AI-powered HR Policy Assistant built using LangGraph.

Key Features:
- Retrieval-Augmented Generation (RAG) using ChromaDB
- Memory support using thread_id for user context
- Tool integration (calculator and date/time)
- Hallucination prevention using eval node
- Personalized responses using employee name
- Streamlit UI for interaction

System Architecture

Flow:
User → Memory Node → Router → (Retrieve / Tool / Skip) → Answer → Eval → Save → End

Each node performs a specific task:
- Memory Node → extracts name
- Router → decides path
- Retrieval → fetches data
- Tool → handles calculations/date
- Answer → generates response
- Eval → checks correctness

Tech Stack

- Python
- LangGraph
- ChromaDB
- Sentence Transformers (Embeddings)
- Streamlit (UI)
- Pandas (testing)
- Regex (tool parsing)

Results

The system was tested with 10 queries:

- Concept queries → correct retrieval
- Tool queries → correct outputs
- Memory query → name recalled correctly
- Red-team tests:
  - Out-of-scope → declined
  - Prompt injection → refused

Faithfulness score: 1.0

Unique Points

- Strict no-hallucination design
- Uses LangGraph structured flow
- Memory persistence using thread_id
- Combines RAG + tools + evaluation
- Handles red-team attacks safely

Future Improvements

- Replace regex tool with structured tool-calling
- Add real HR database/API integration
- Multi-language support
- Mobile/web deployment
